1-Visit anaconda.com to download the latest installer.

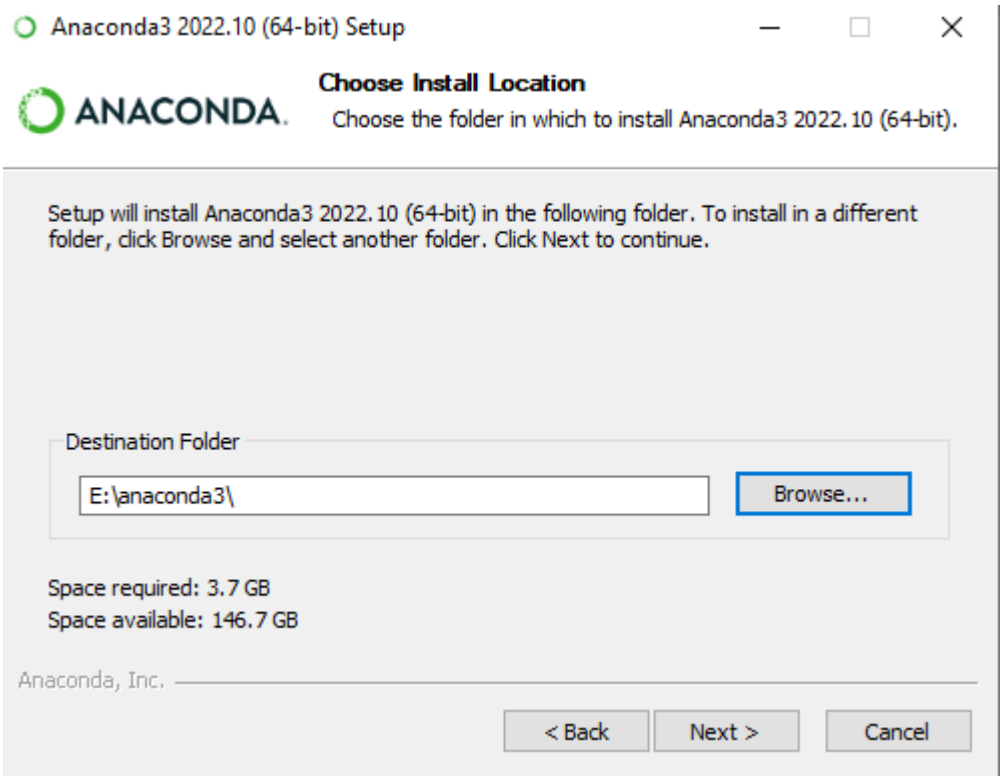

2- Download the Anaconda installer – this is a very large download @ ~700 MB

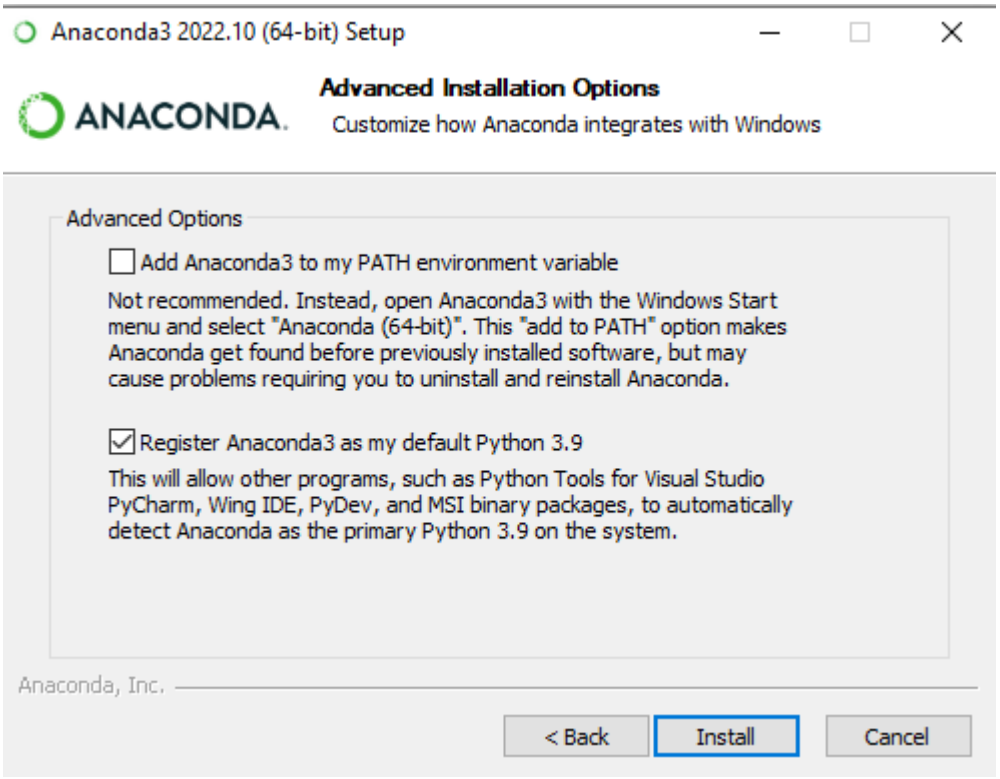

3- Go to your Downloads folder and double-click the installer to launch.

4- Install Anaconda:

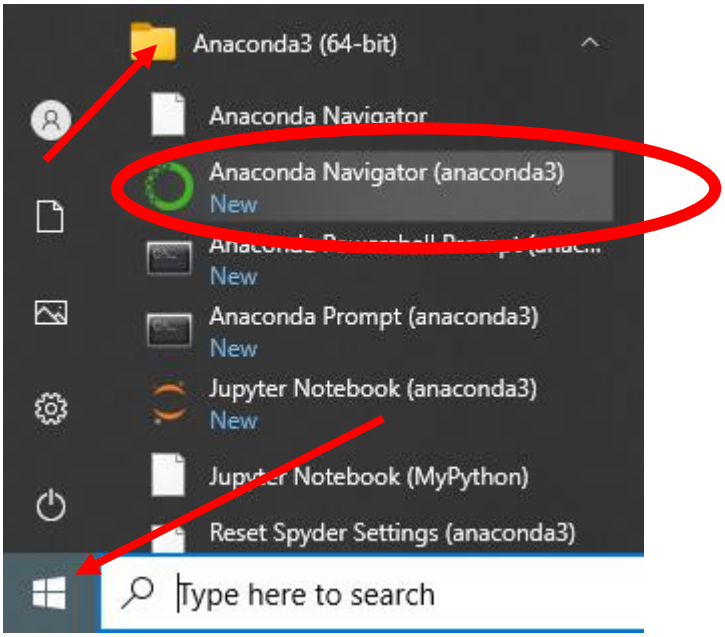

Choose where to install:

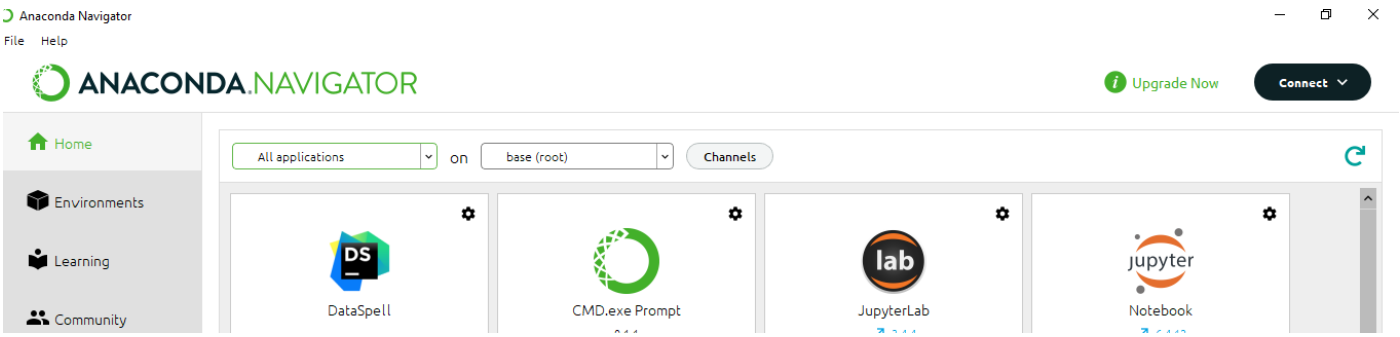

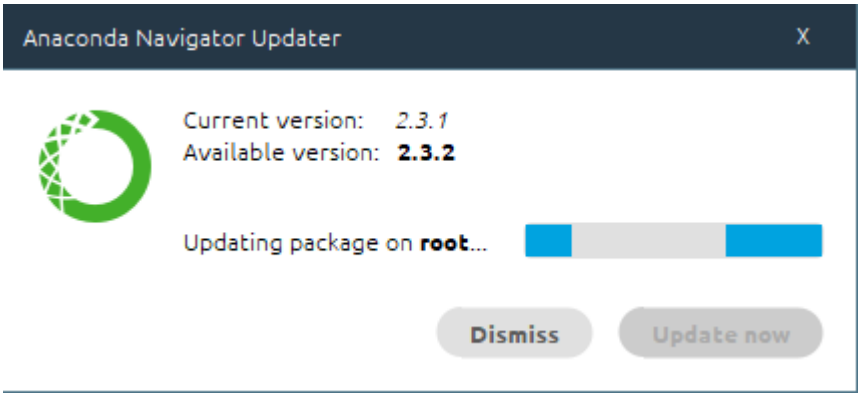

5- Run Anaconda Navigator

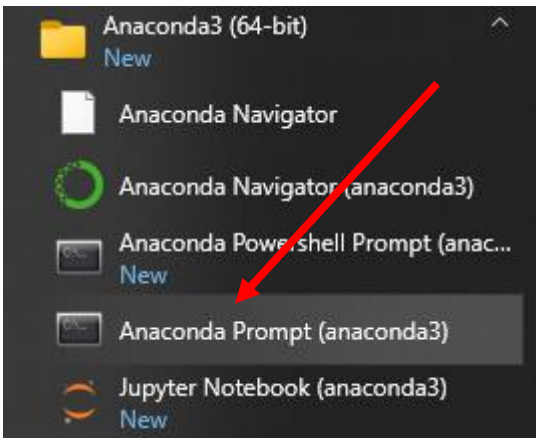

6- Upgrade!

With conda, you can **create**, export, list, remove, and update environments that have **different versions of Python** and/or packages installed in them**. Switching or moving between environments** is called **activating the environment**.

Click on **Anaconda Prompt** and execute the following commands in the given order.

*conda create -n DSP python=**3.9.16***

conda activate DSP

python –version

conda install numpy

conda install matplotlib

conda install scipy

conda install jupyter

pip install pyfda

```
(base) C:\Users\ders>conda create -n DSP python=3.9.16
WARNING: A directory already exists at the target location 'E:\anaconda3\envs\DSP'
but it is not a conda environment.

## Package Plan ##

  environment location: E:\anaconda3\envs\DSP

  added / updated specs:
    - numpy

The following packages will be downloaded:

    package                    |            build
    ---------------------------|-----------------
    numpy-1.23.5               |   py39h3b20f71_0          11 KB
    numpy-base-1.23.5          |   py39h4da318b_0         6.0 MB
    ------------------------------------------------------------
                                           Total:         6.0 MB
```

Using the DSP environment

On **the Environments page**, the left column displays **your environments**.

In the environments list, **select the environment** **DSP** to activate it.

Click the **arrow button** next to **DSP** to open the activation options dropdown.

Select one of the following options for opening the environment: Terminal, Python interpreter, IPython Console, or **Jupyter Notebook**. In this course, you will use Jupyter Notebook to return all computer-based homework and other assignments.
